

Apollo and Gamma Ray Measurements with Helios at Argonne

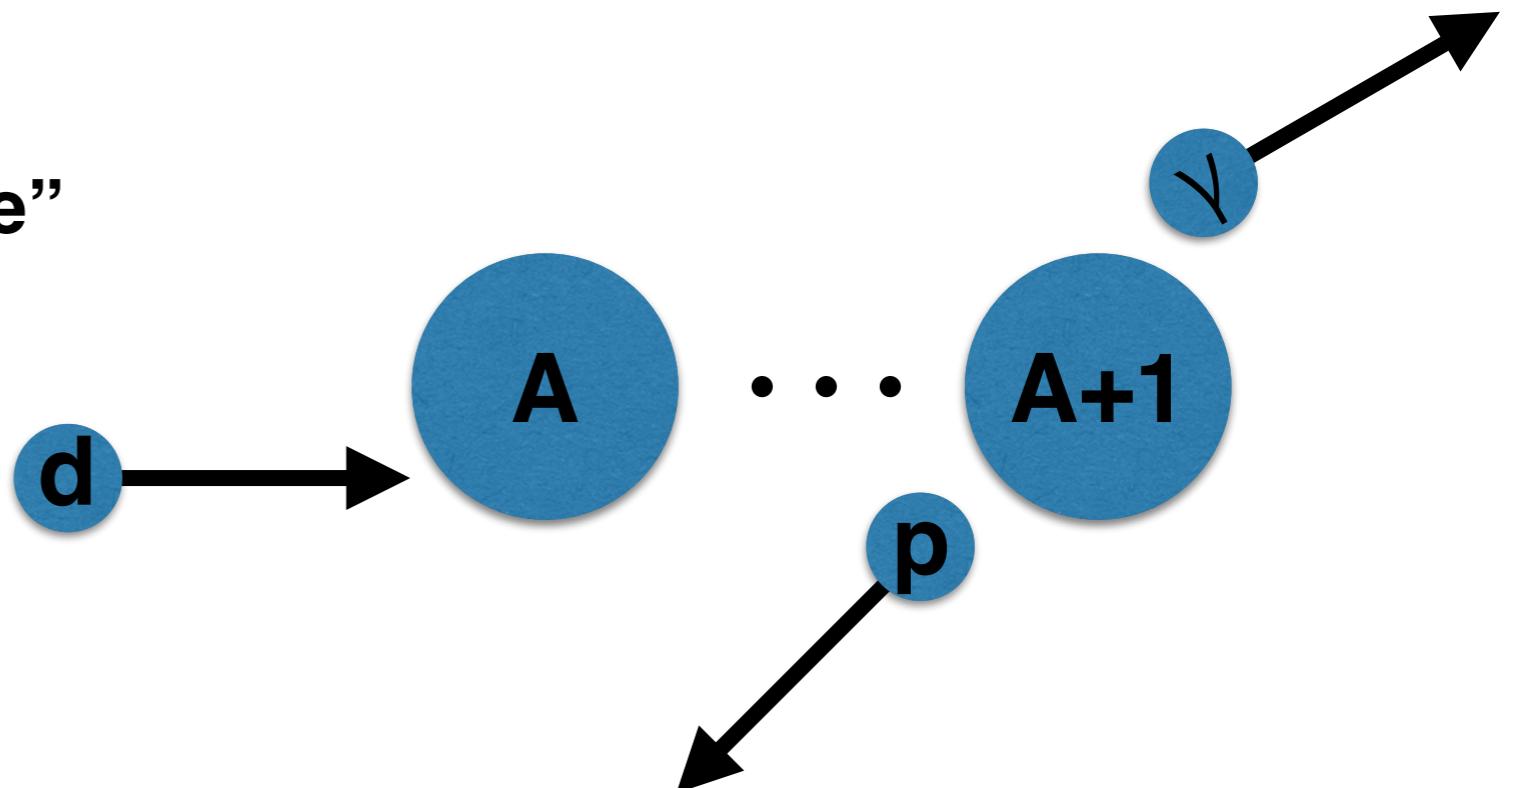

Jack Winkelbauer
Los Alamos National Laboratory

Neutron Capture and the Photon Strength Function

- Reasonable (n,γ) predictions require reasonable gamma ray de-excitation predictions

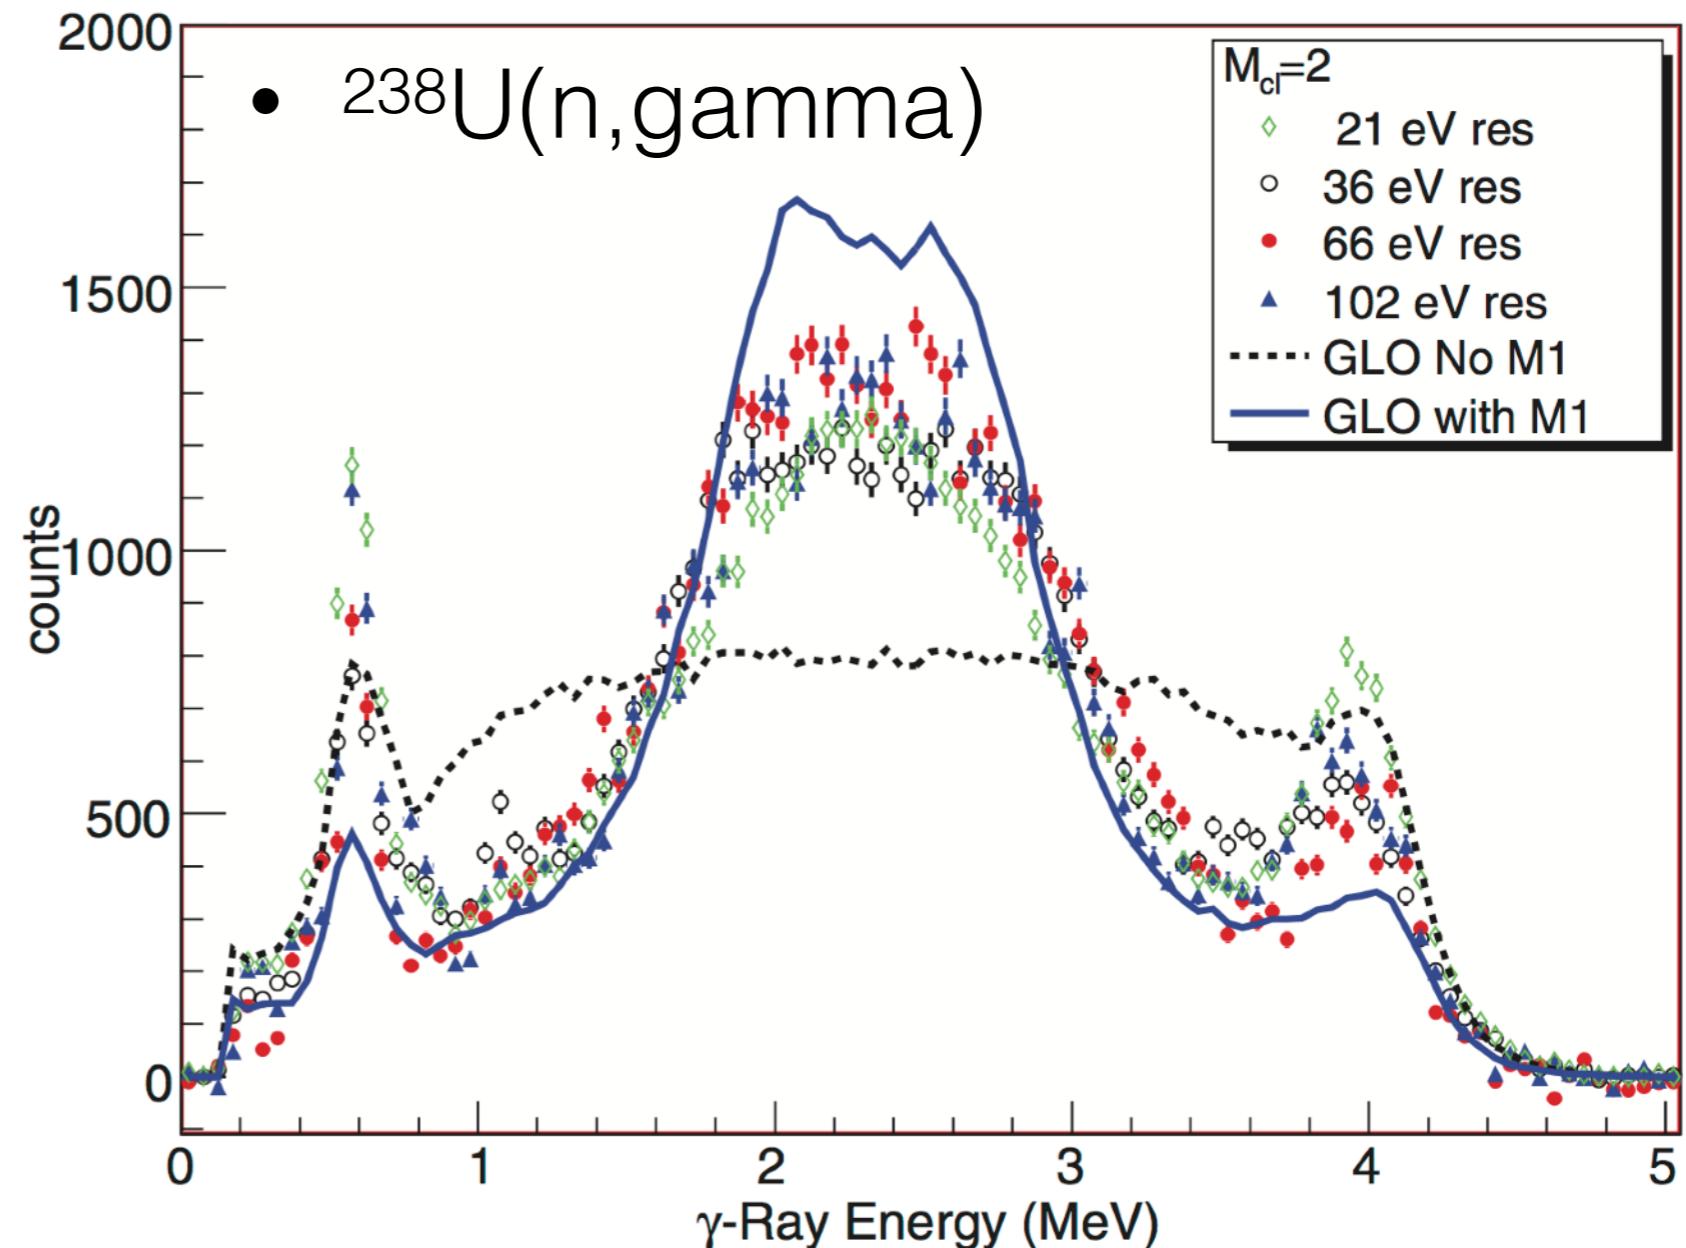

- If direct measurement is impossible, (n,γ) can be studied using “surrogate” reactions

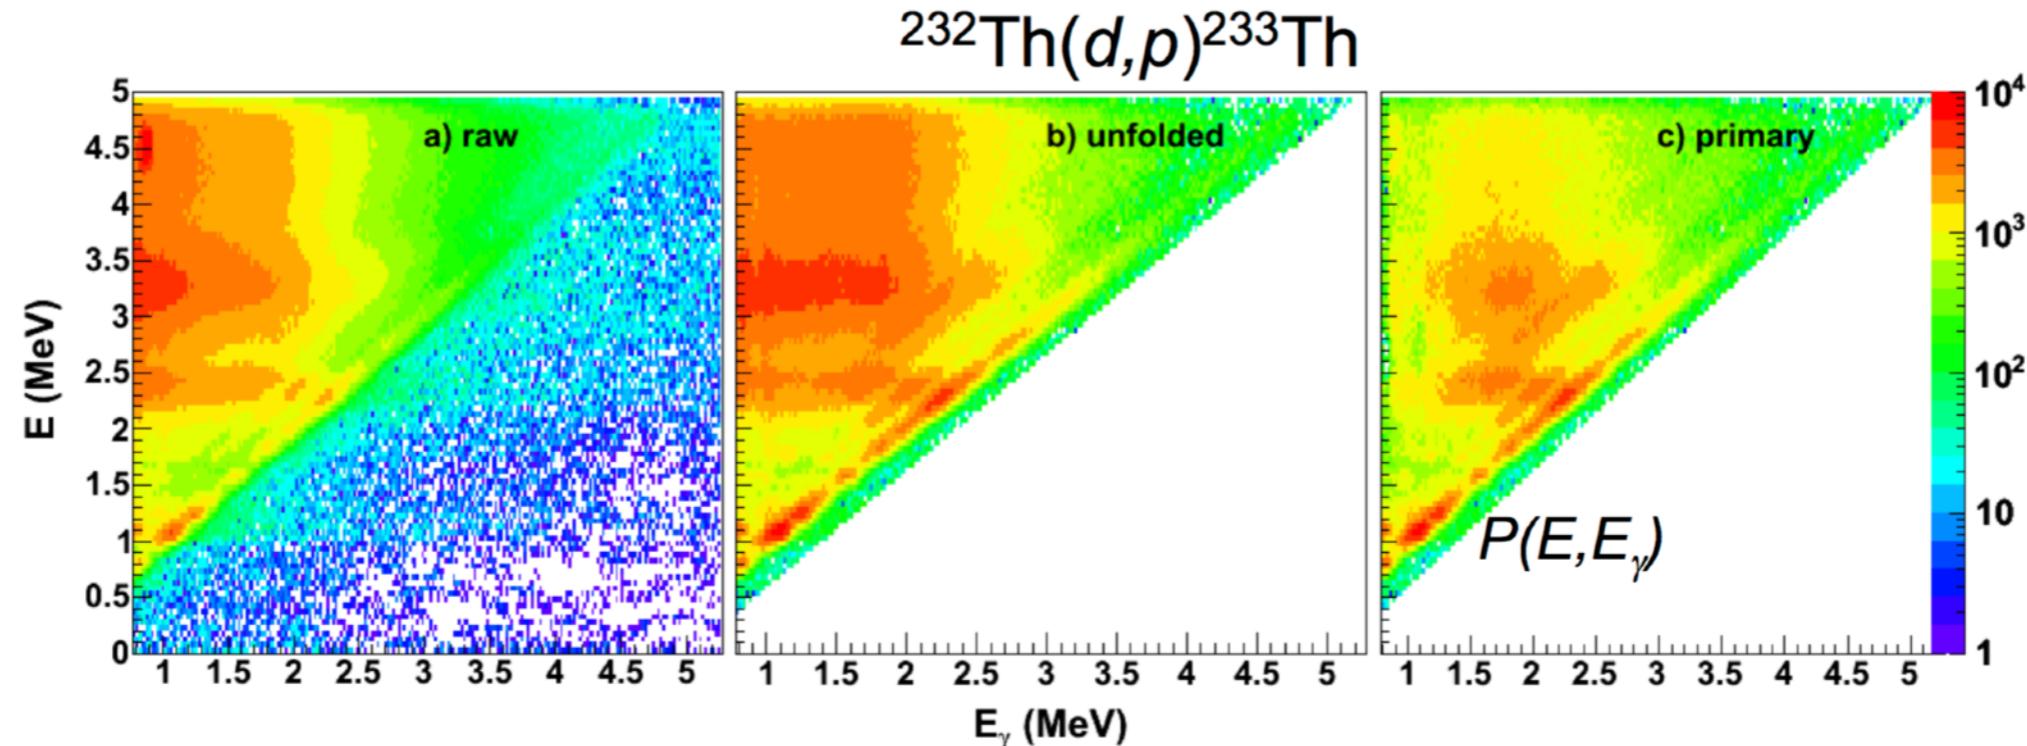

- Observed γ -spectrum $\approx (\text{PSF}) \times (\text{Level Density})$

“Spectrum Fitting” Method

- “Forward Analysis” using Geant4 simulation
- Direct (n,γ) measurements at LANSCE
- Demonstrated with heavy, medium mass nuclei.
- Can also be applied to indirect reaction studies

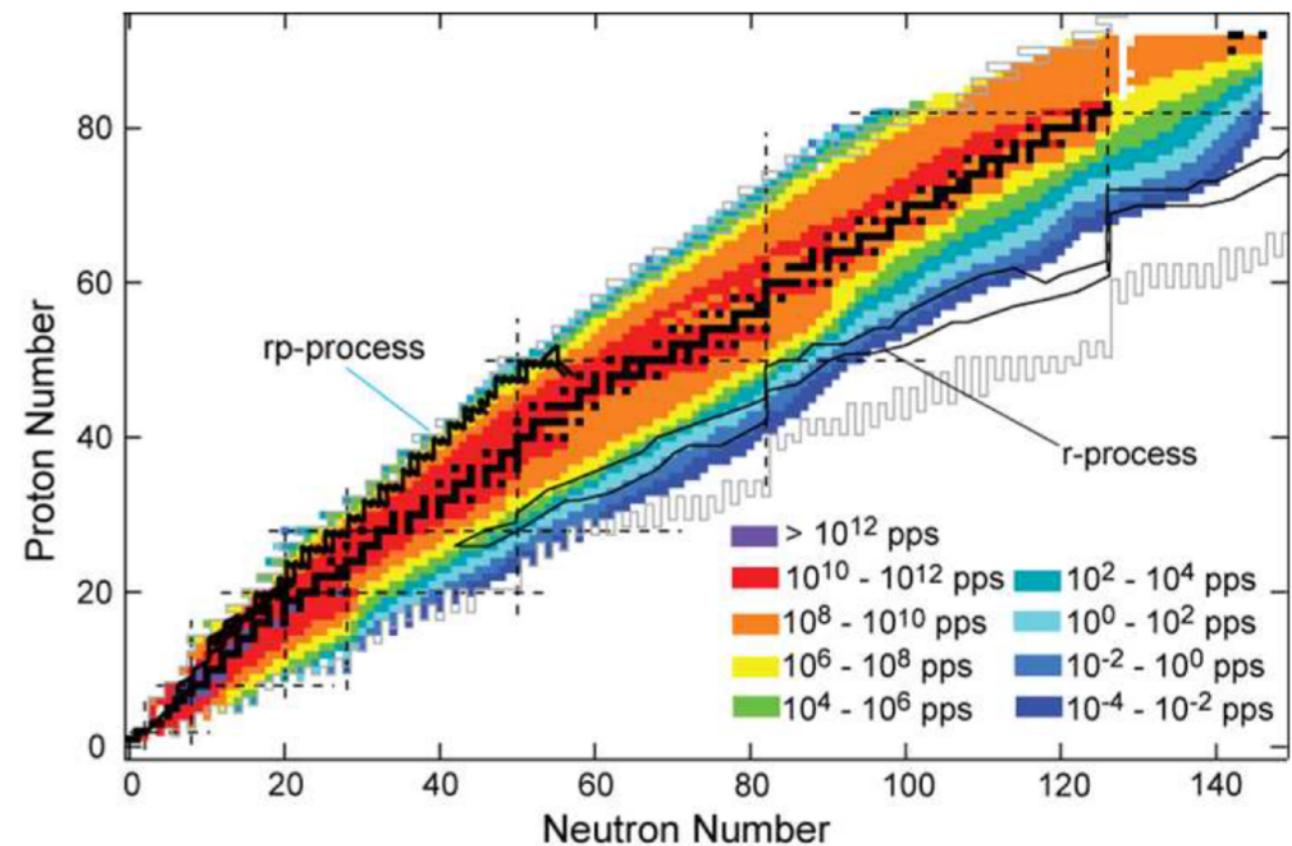

The “Oslo” Method

- Transfer and Inelastic Scattering reactions (normal kinematics), Beta-Oslo at MSU
 - Brink-Axel Hypothesis
 - “Low energy enhancement”
- Extract PSF and NLD “simultaneously”

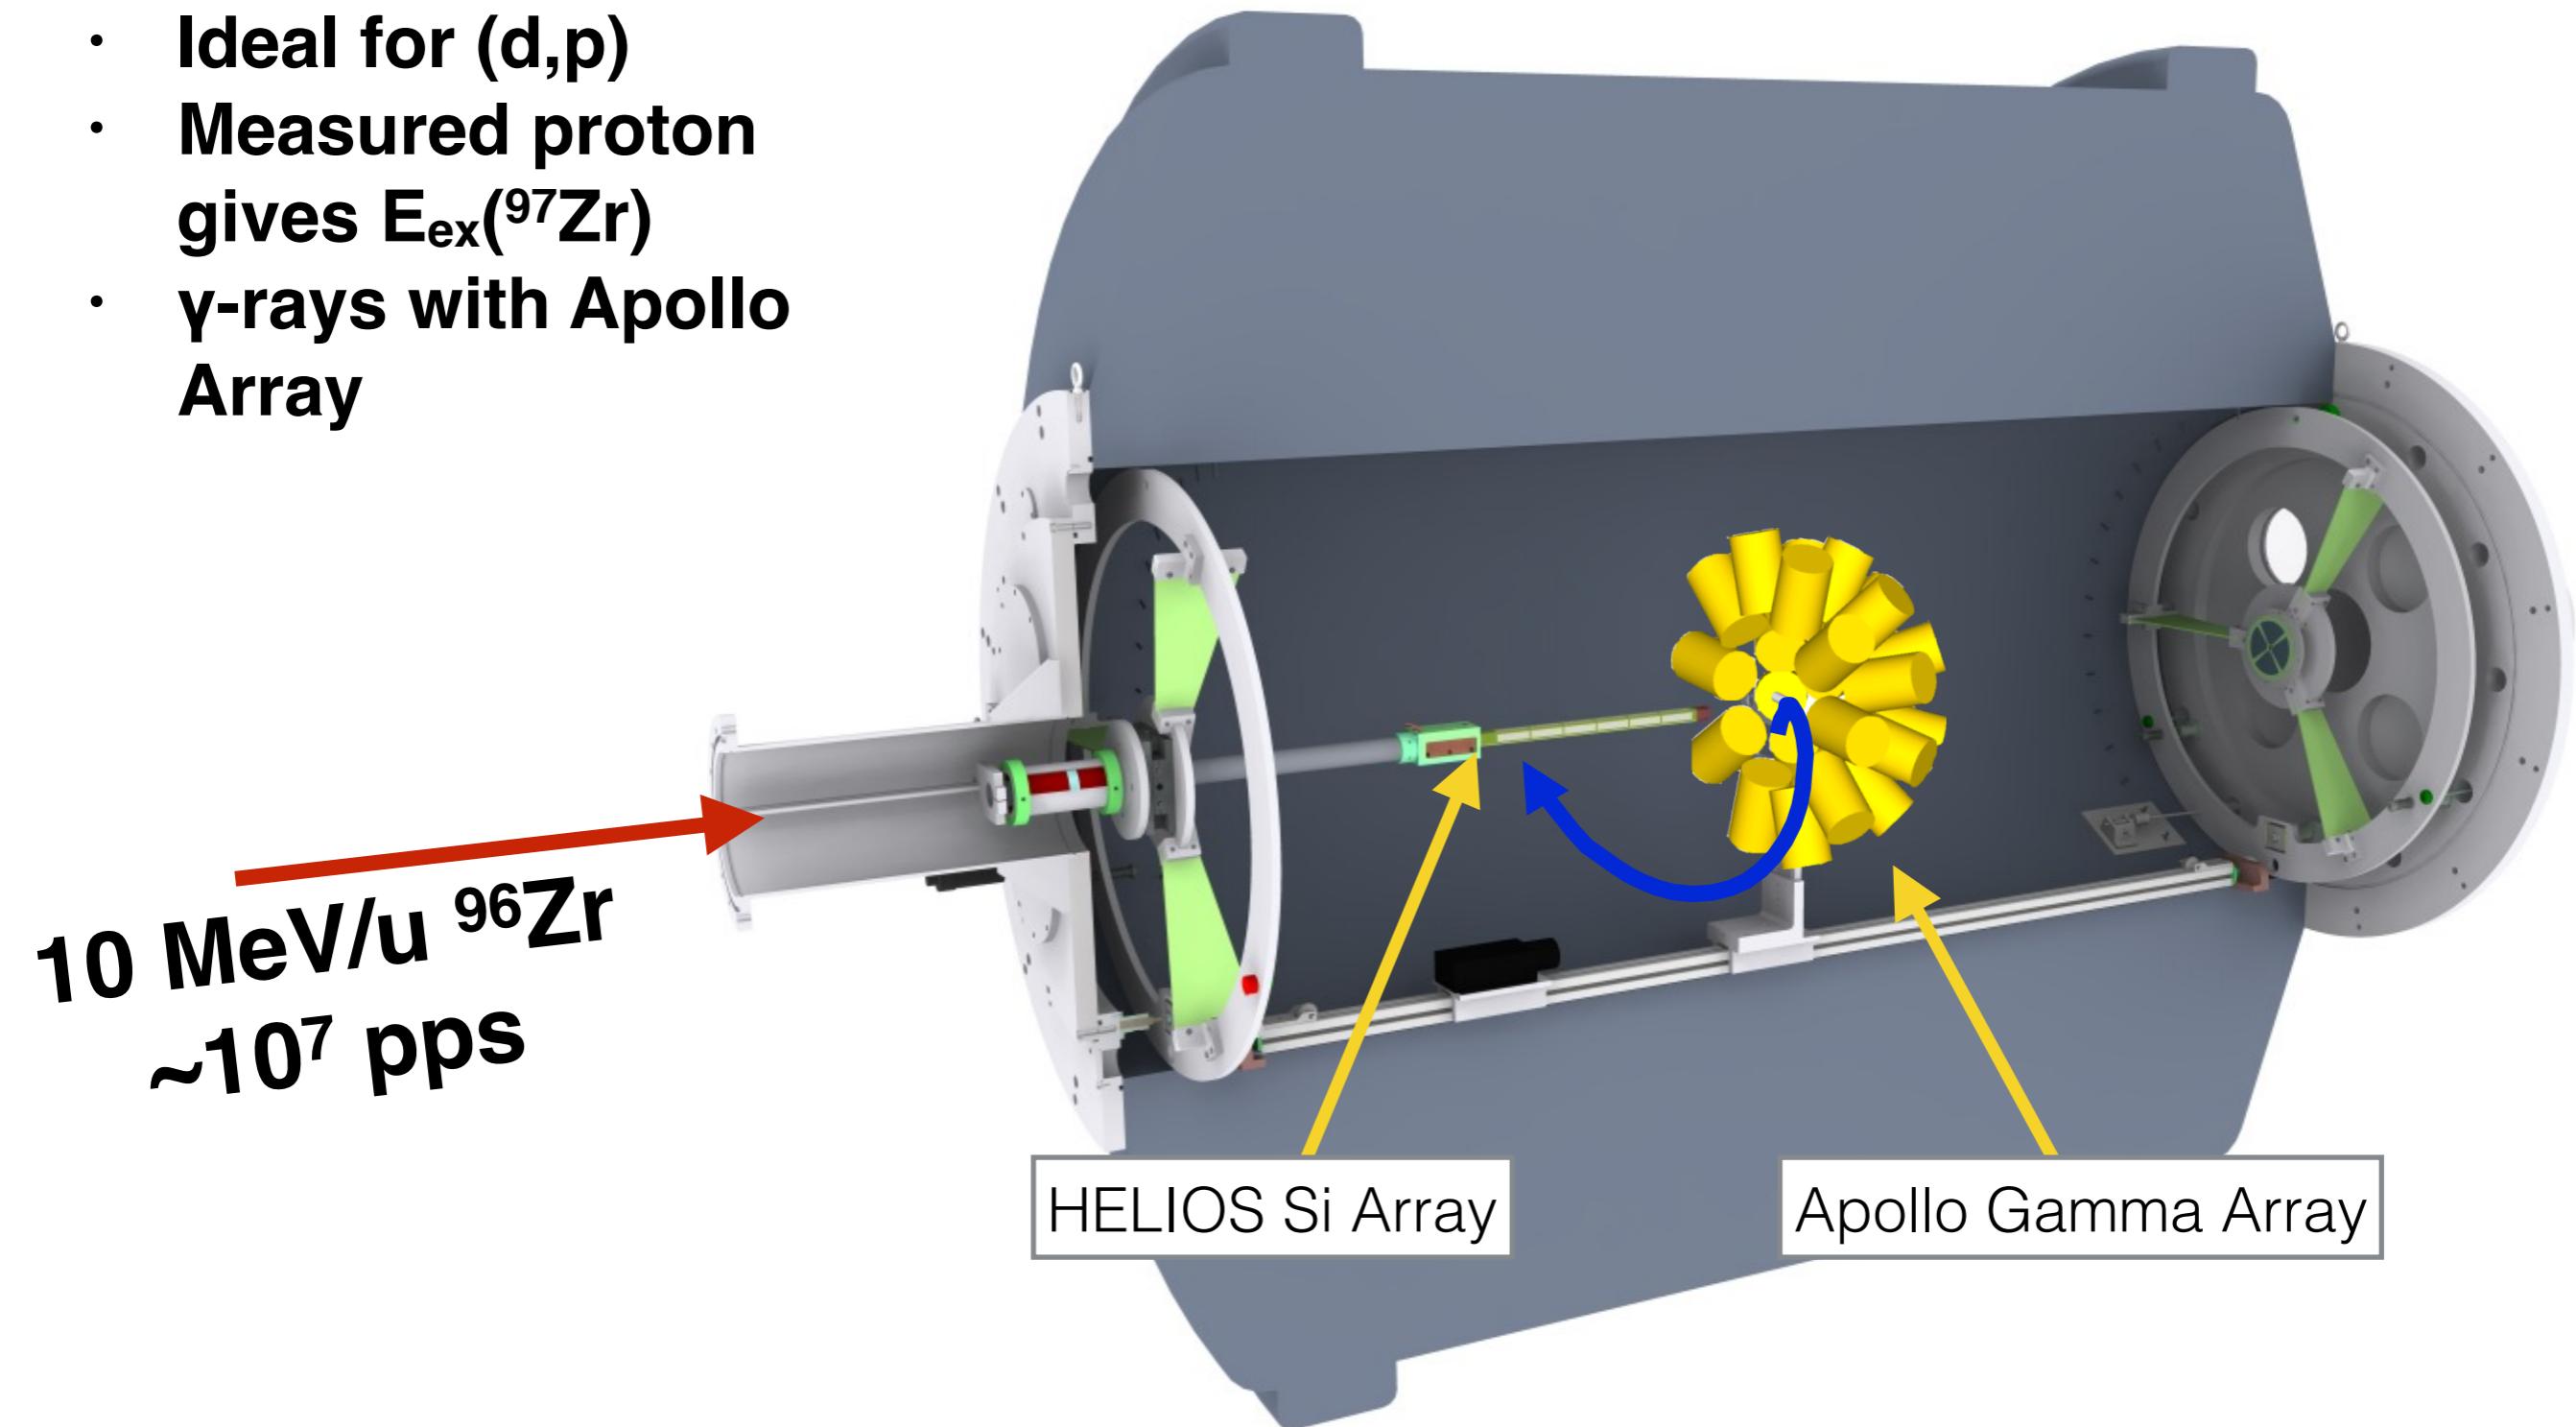

Objectives

- Does PSF from (d,p) look like PSF from (n, γ)?
- Does “Oslo” get it right?
- How to connect statistical model to discrete nuclear structure?
- Long term: Constrain (n, γ) for unstable nuclei at ATLAS and then FRIB

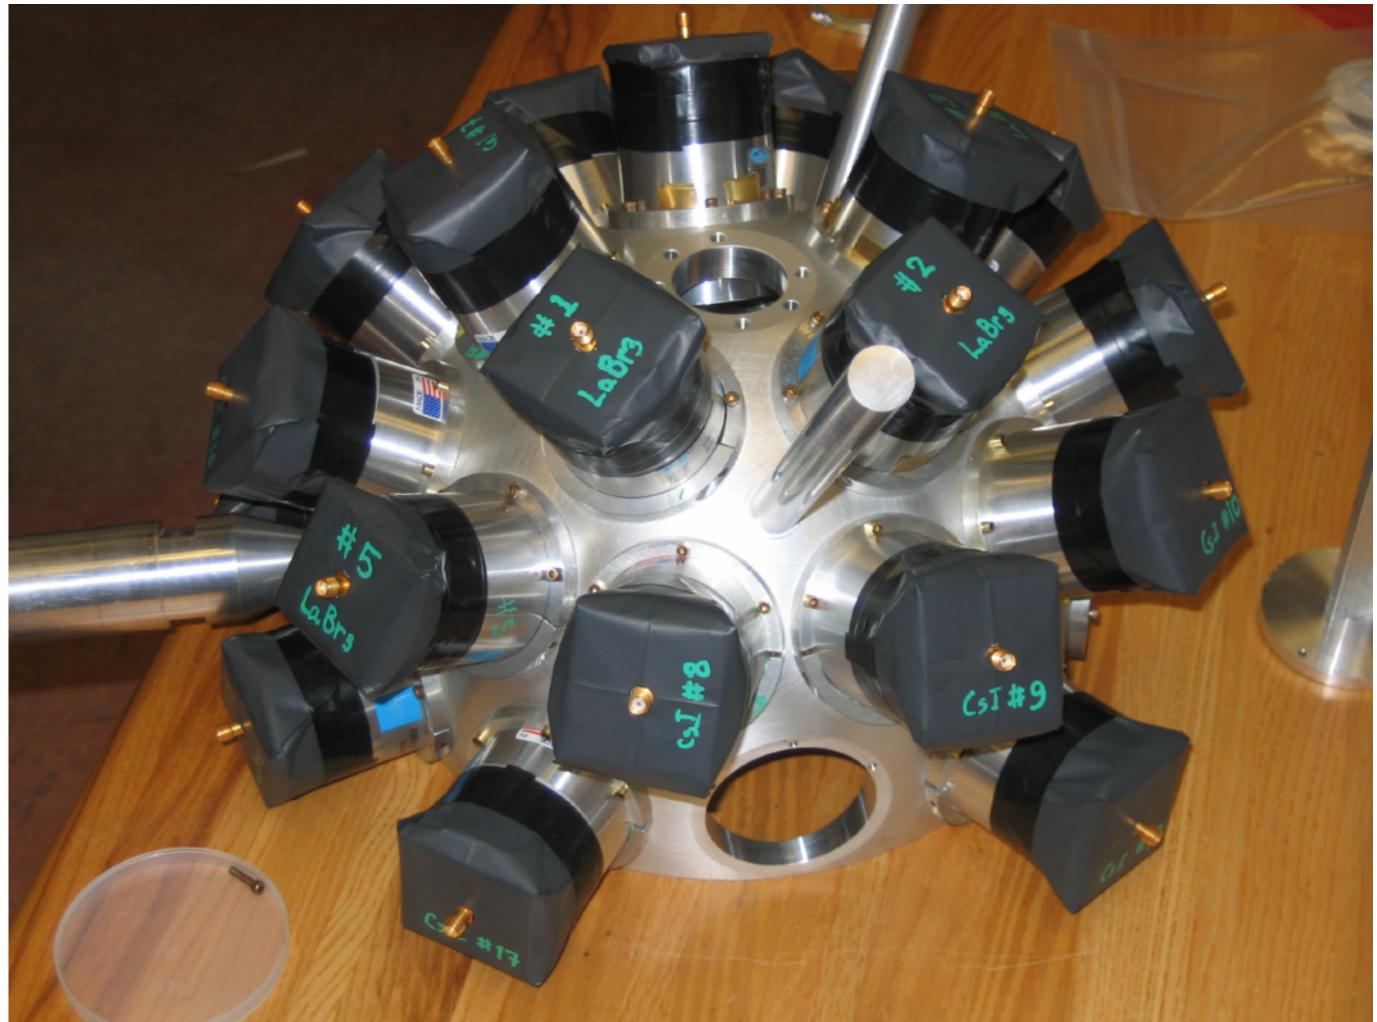

Apollo+Helios at ATLAS

- Ideal for (d,p)
- Measured proton gives $E_{ex}(^{97}\text{Zr})$
- γ -rays with Apollo Array

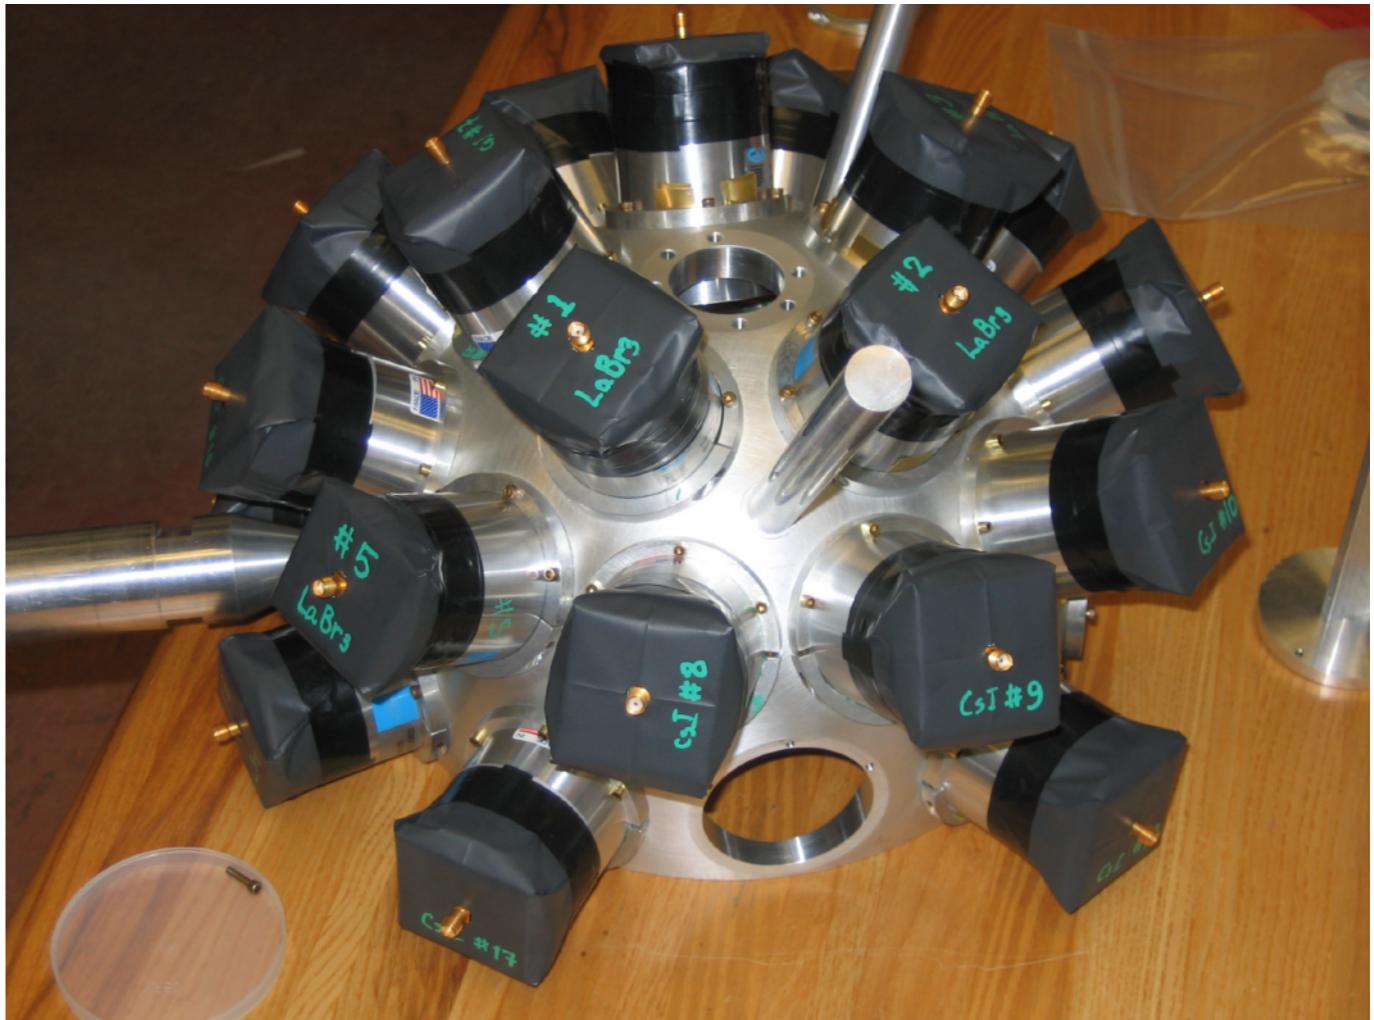

Apollo Array

- Designed and built at LANL 2011-2012
- Moved to ANL 2013
- Tested with beam inside Helios - June 2014
- First physics run $^{96}\text{Zr}(\text{d},\text{p})$ - April 2016
- $^{57}\text{Fe}(\text{d},\text{p})$ - Aug. 2016
- Isomeric $^{18}\text{F}(\text{d},\text{p})$ - Oct. 2016
(D. Santiago)

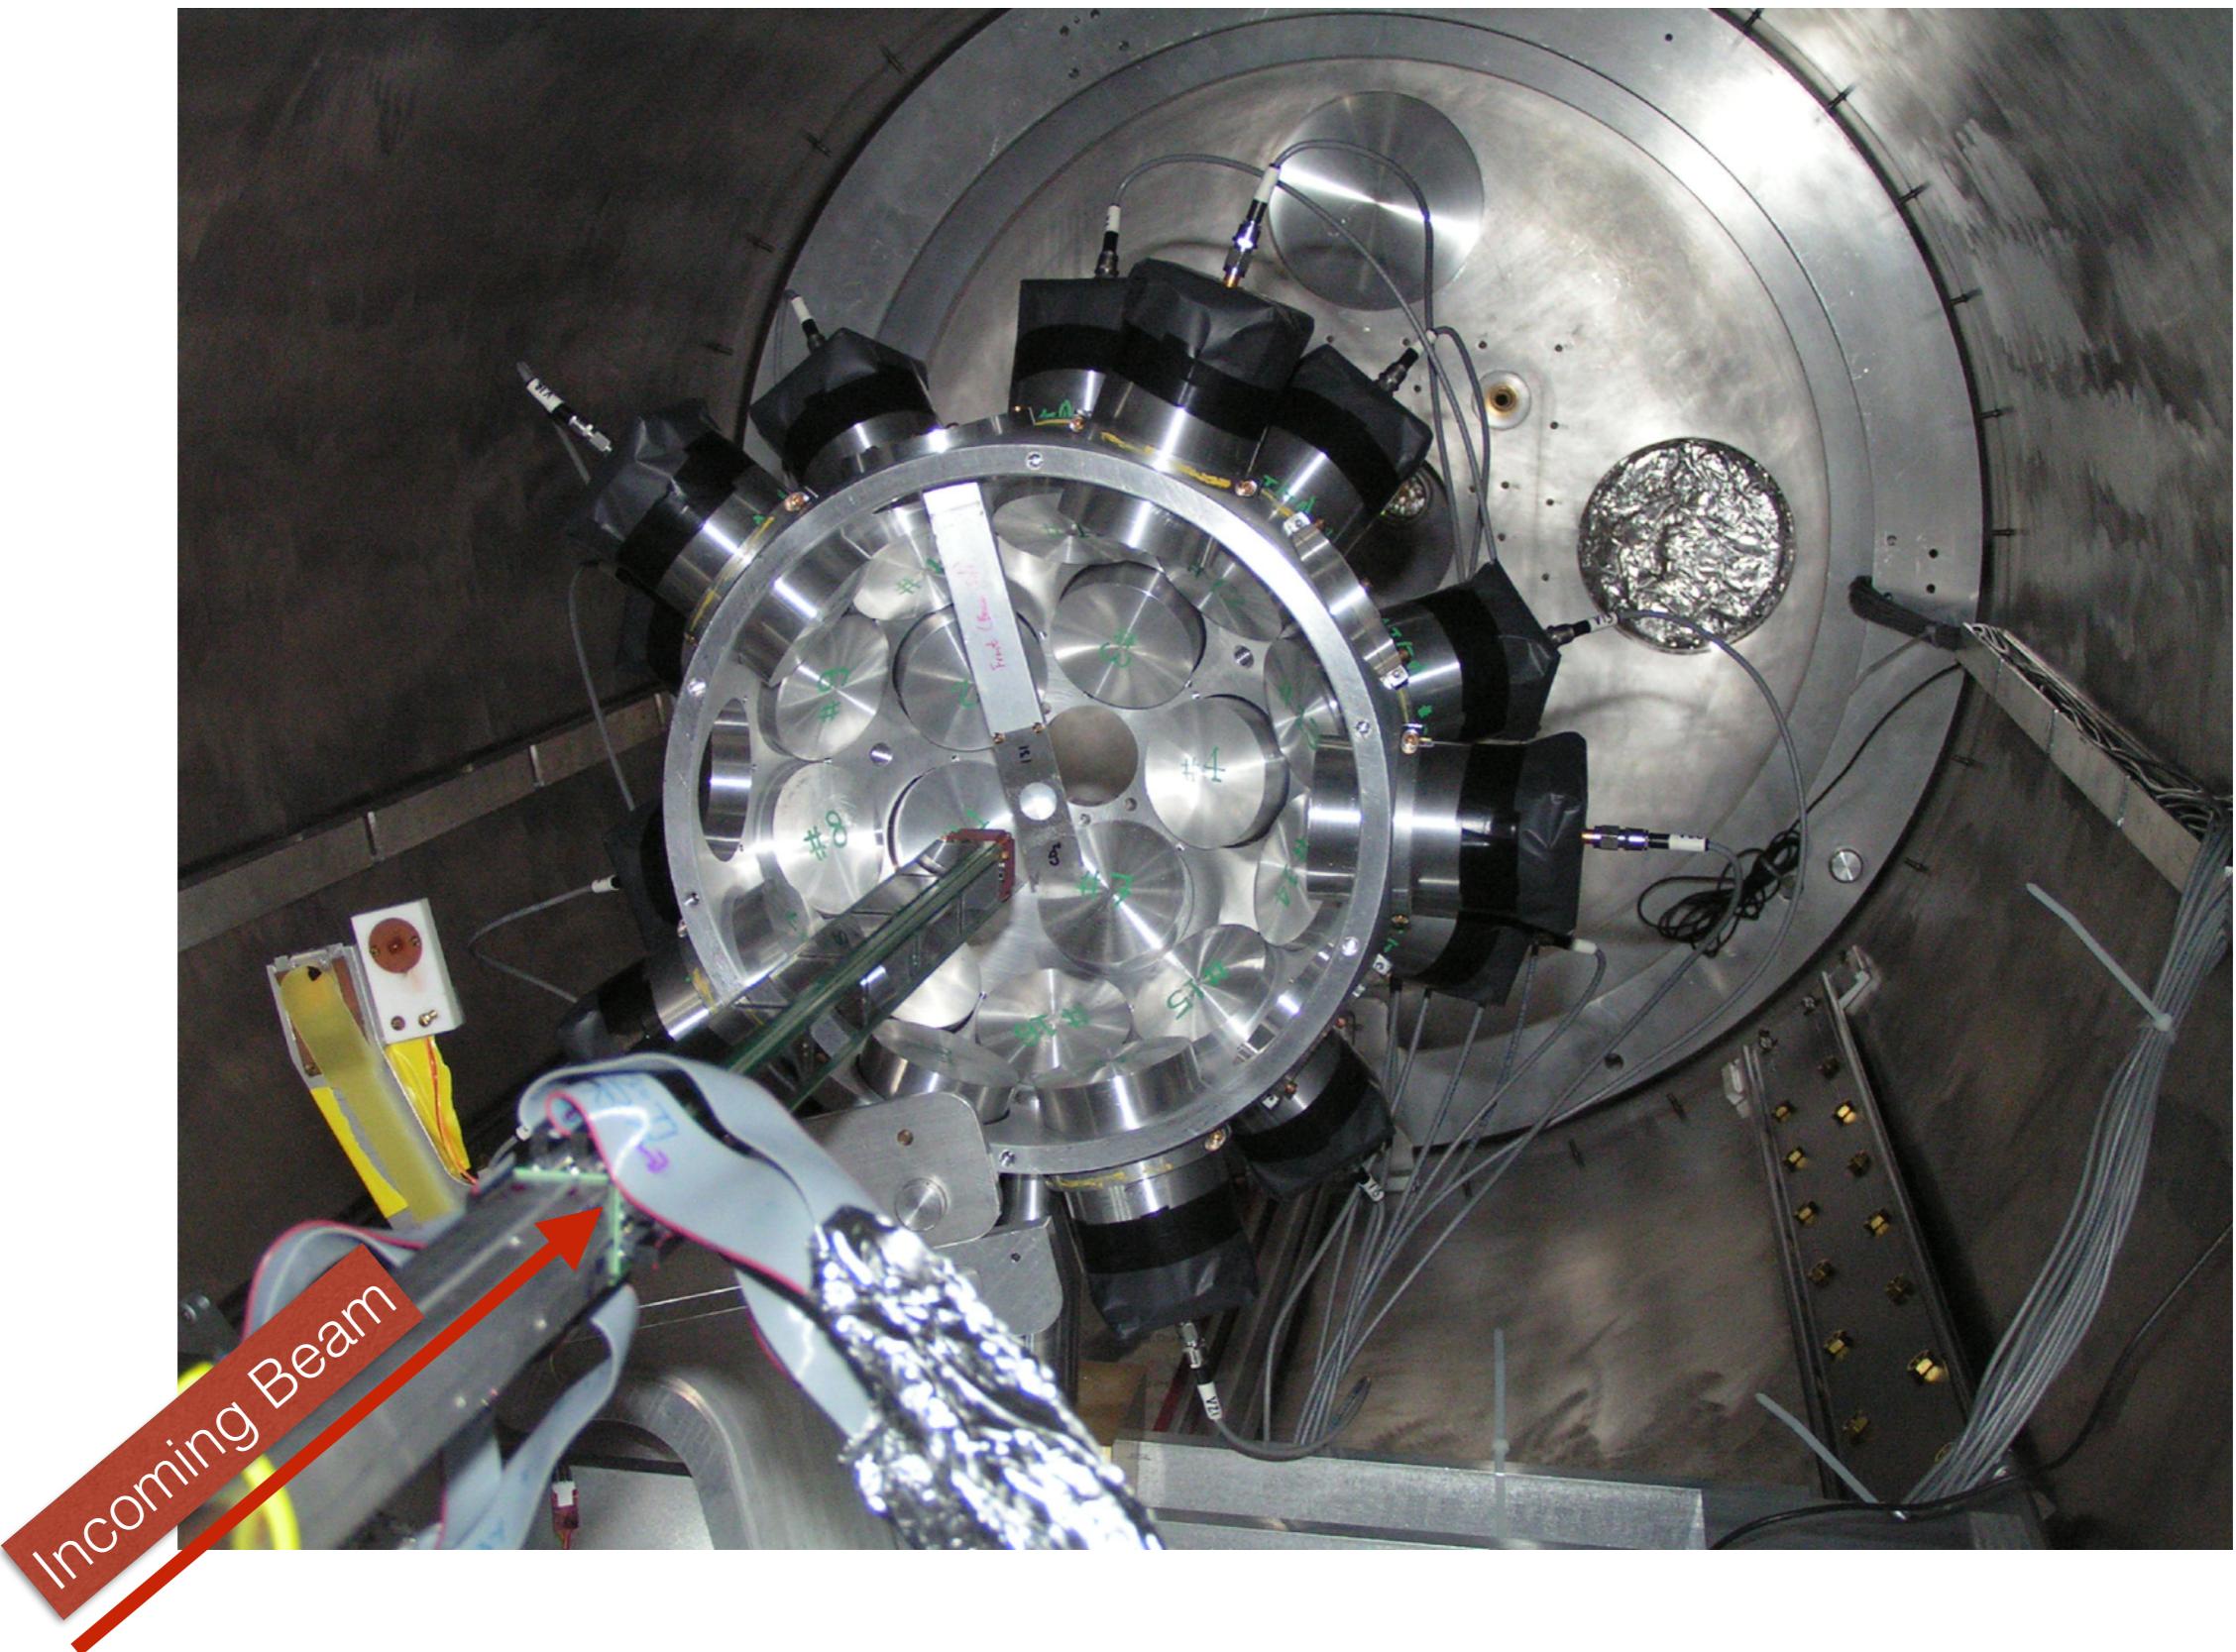

Apollo Array

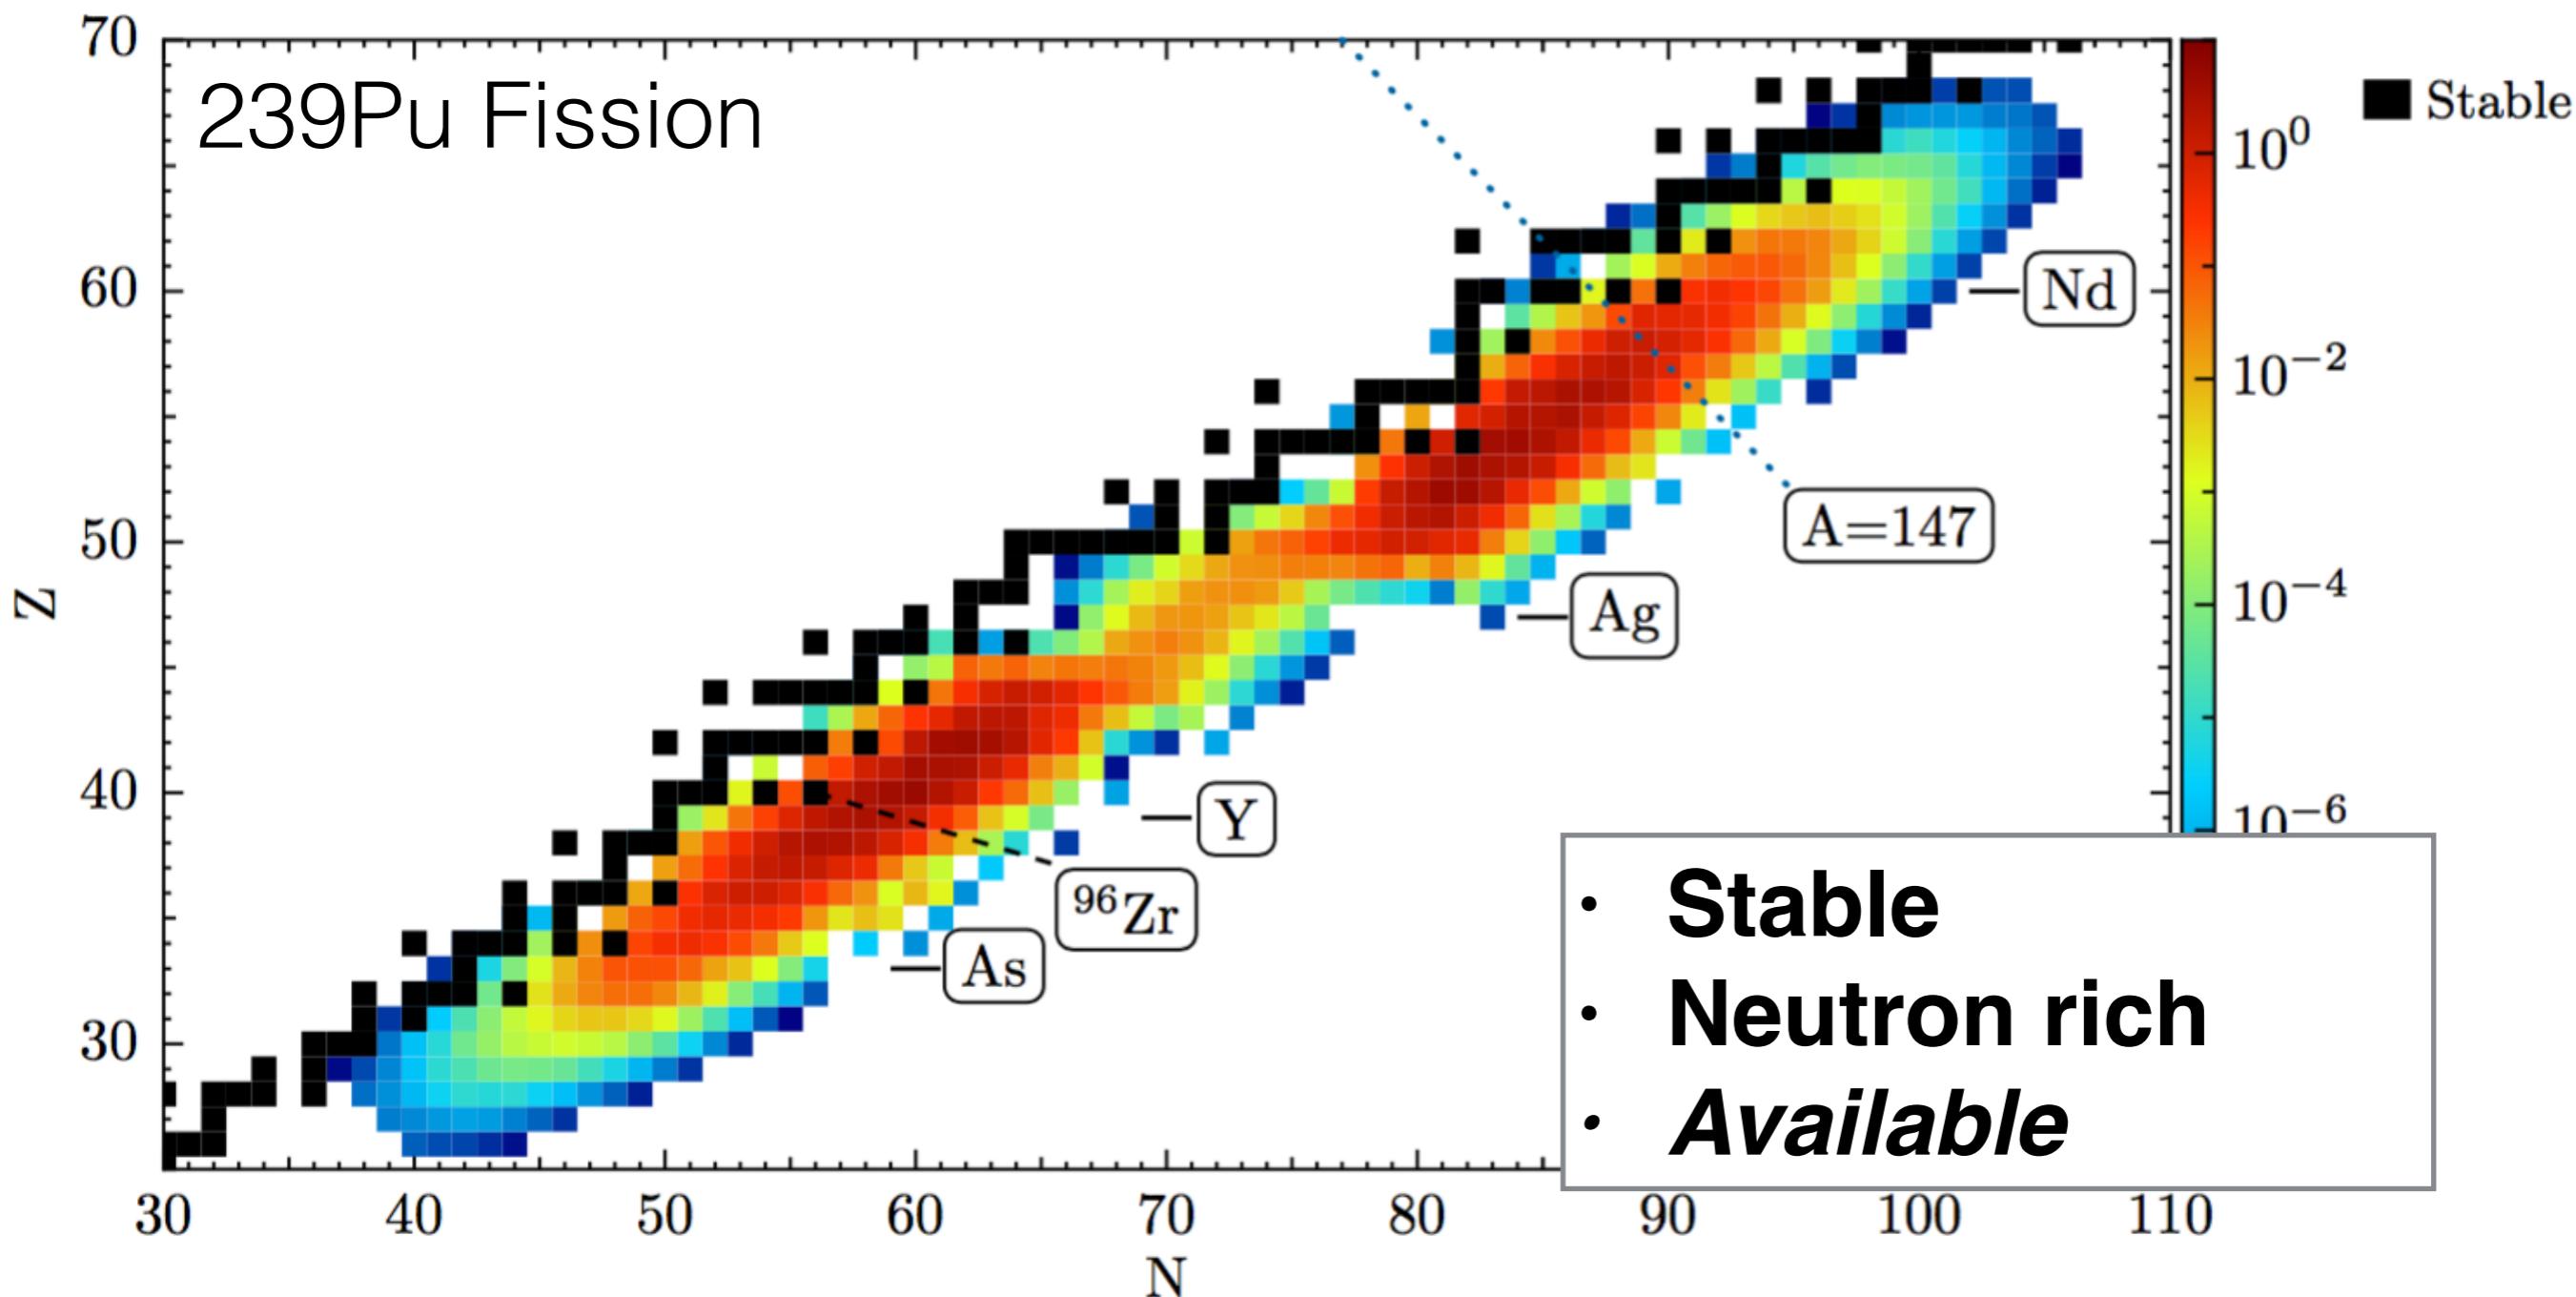

- **21 Detectors (6 LaBr, 15 CsI)**
- **2" x 3" crystals, light readout with Silicon Photomultipliers**
- **Compact, portable**
- **Unaffected by magnetic field**

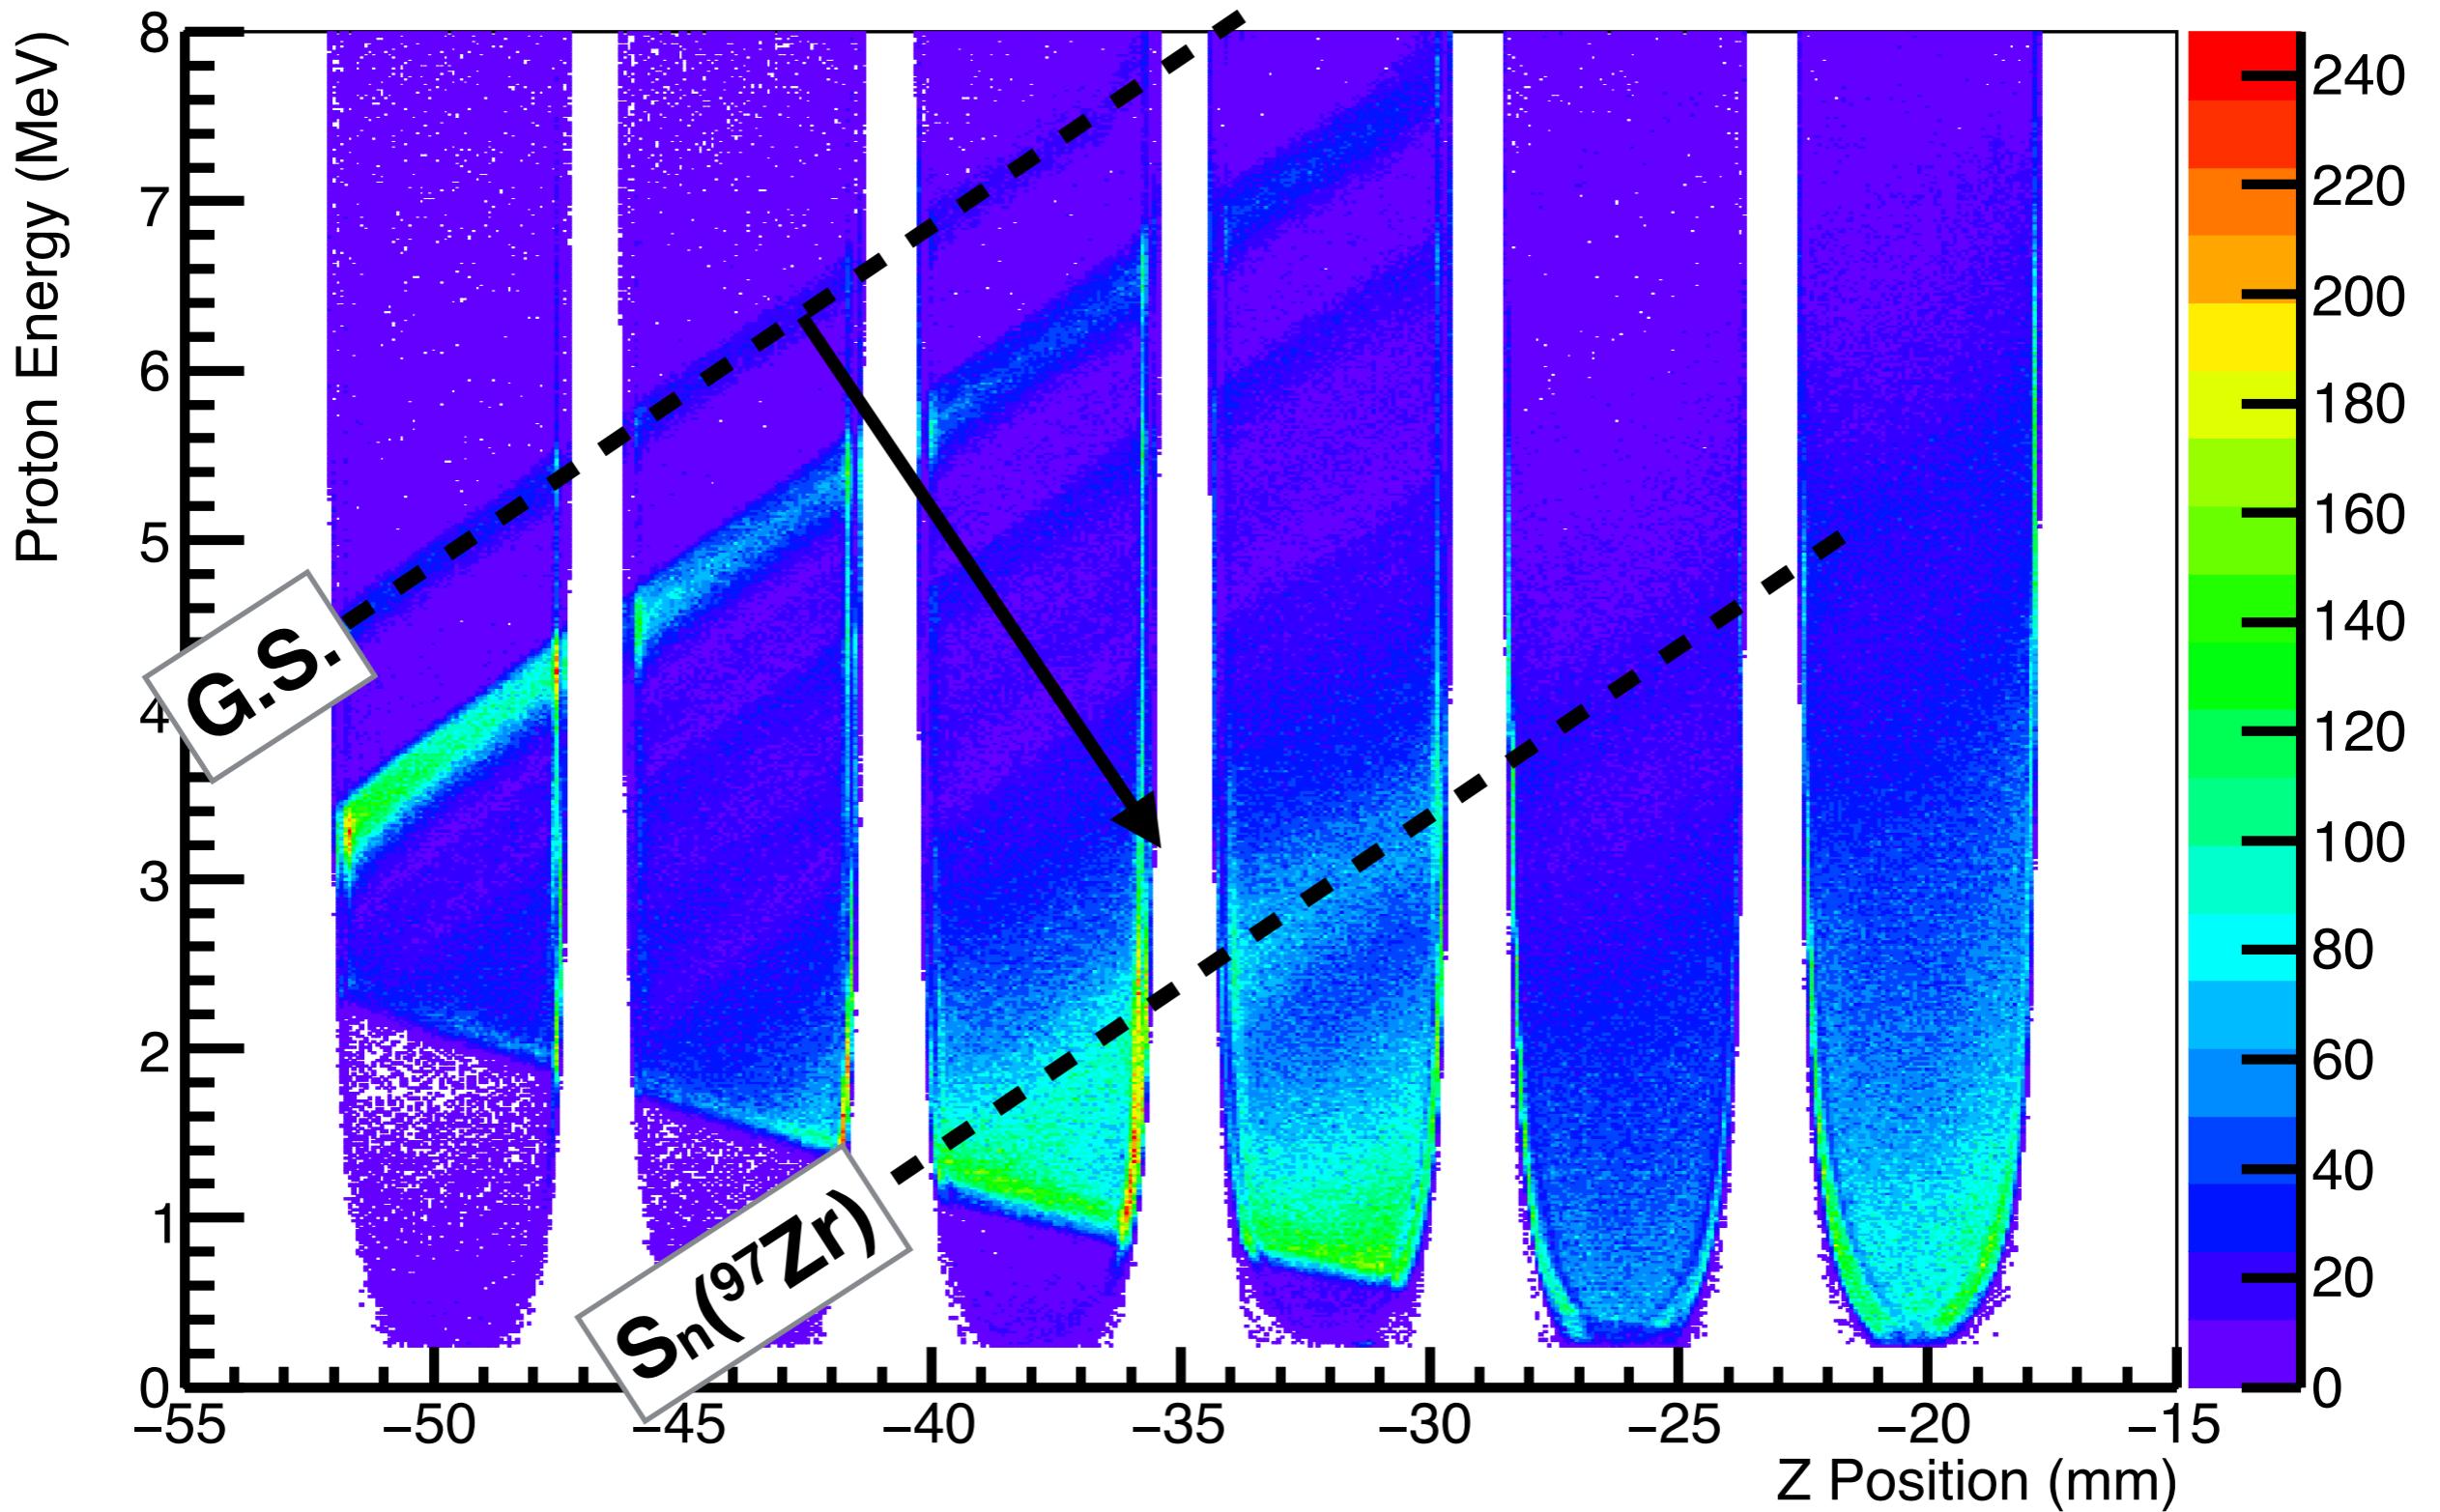

Apollo + Helios

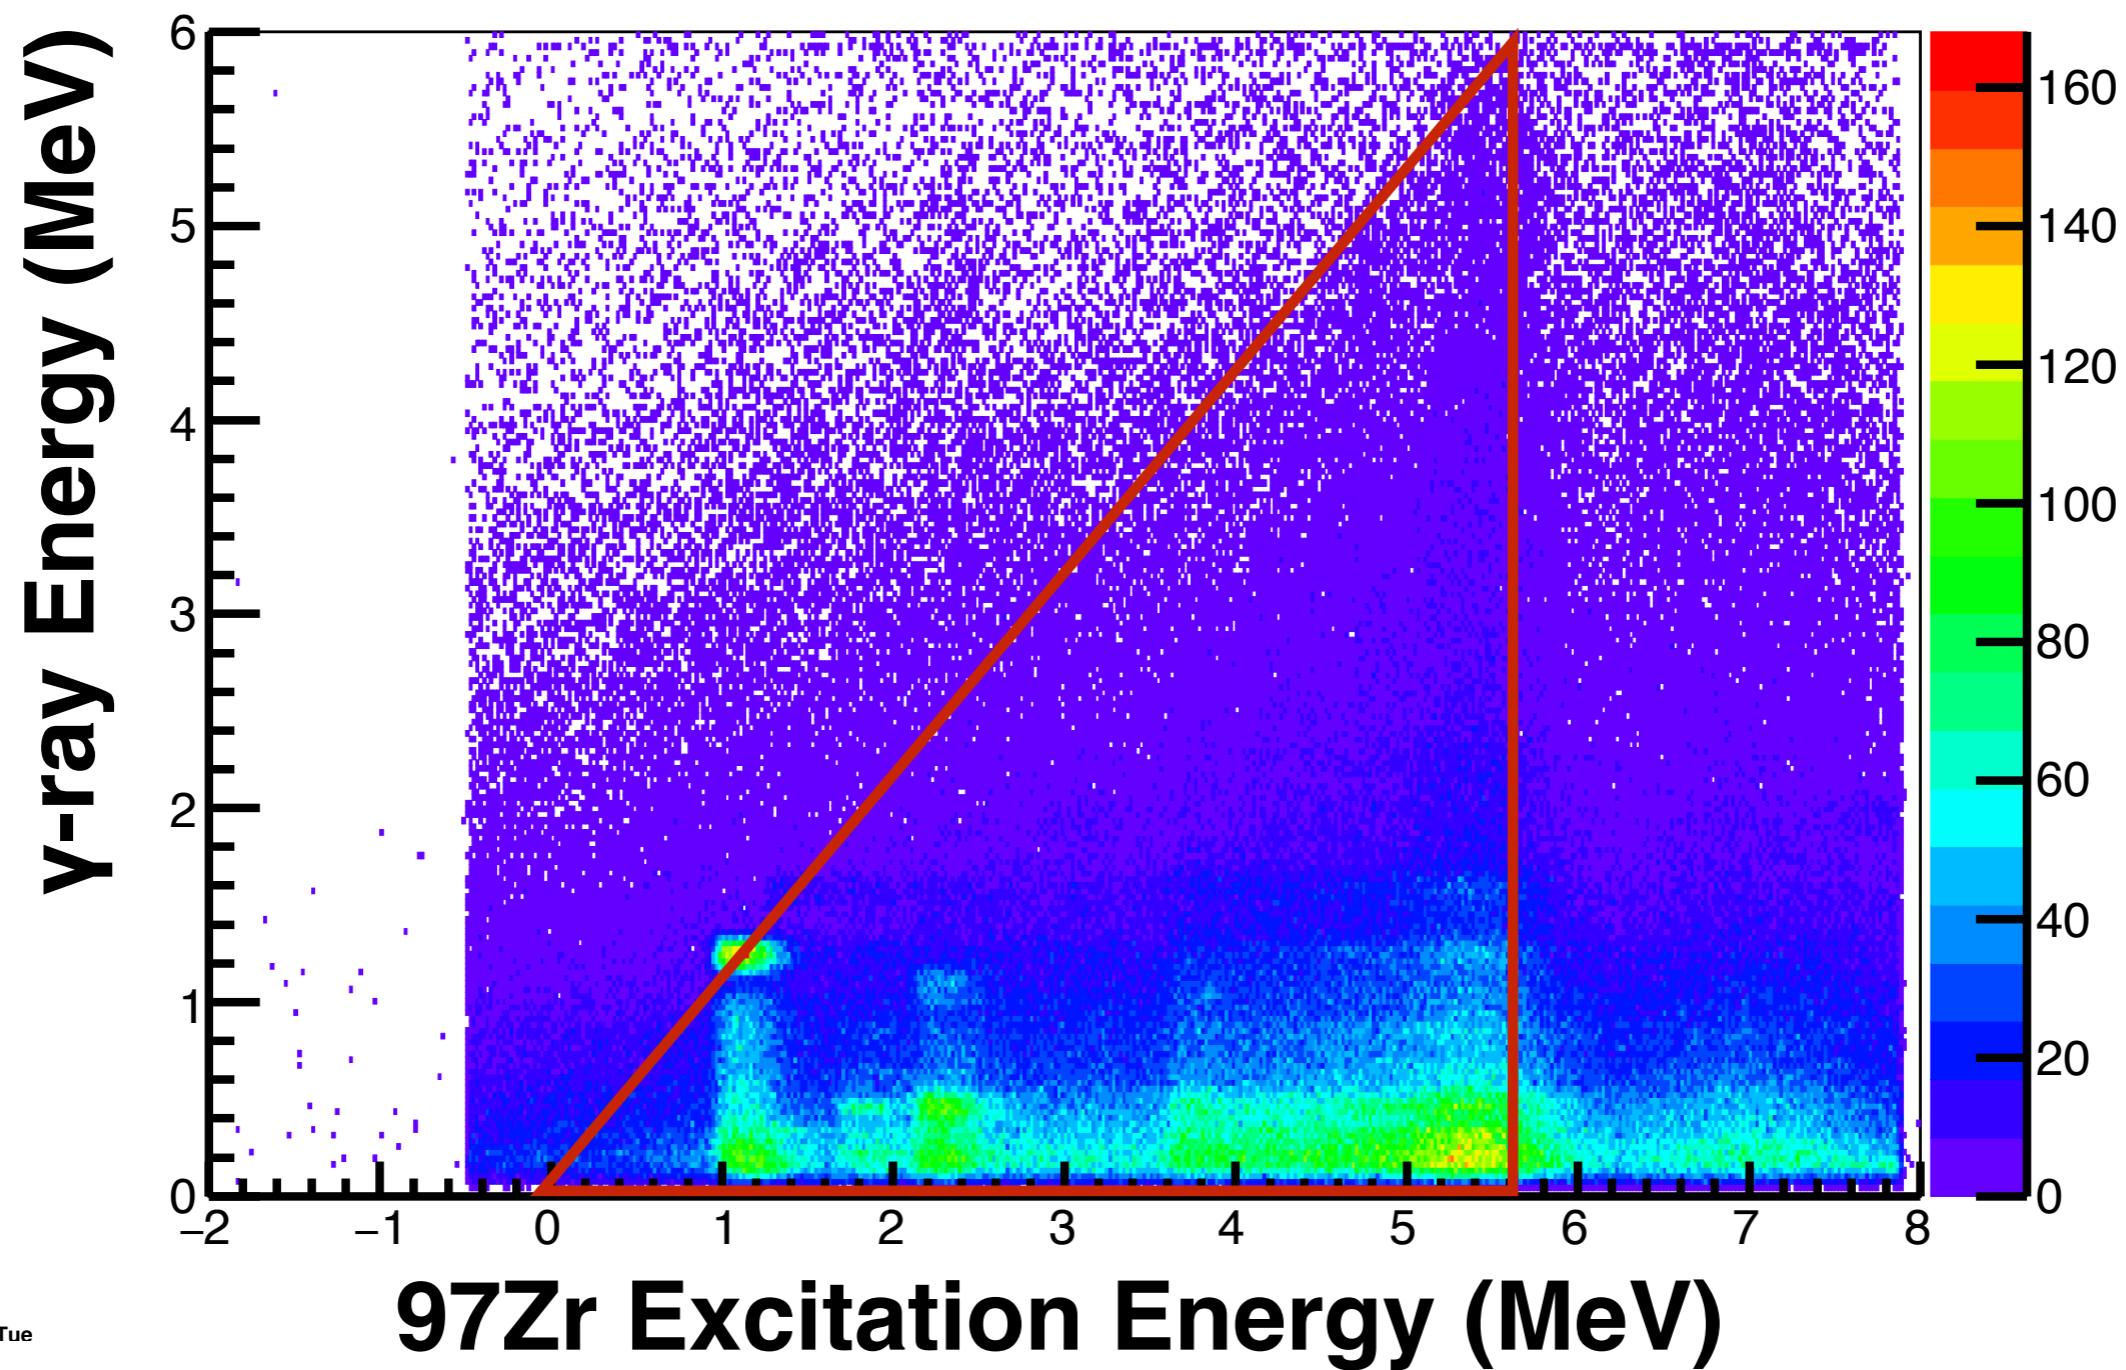

96Zr - A Test Case

$^{96}\text{Zr}(\text{d},\text{p})$

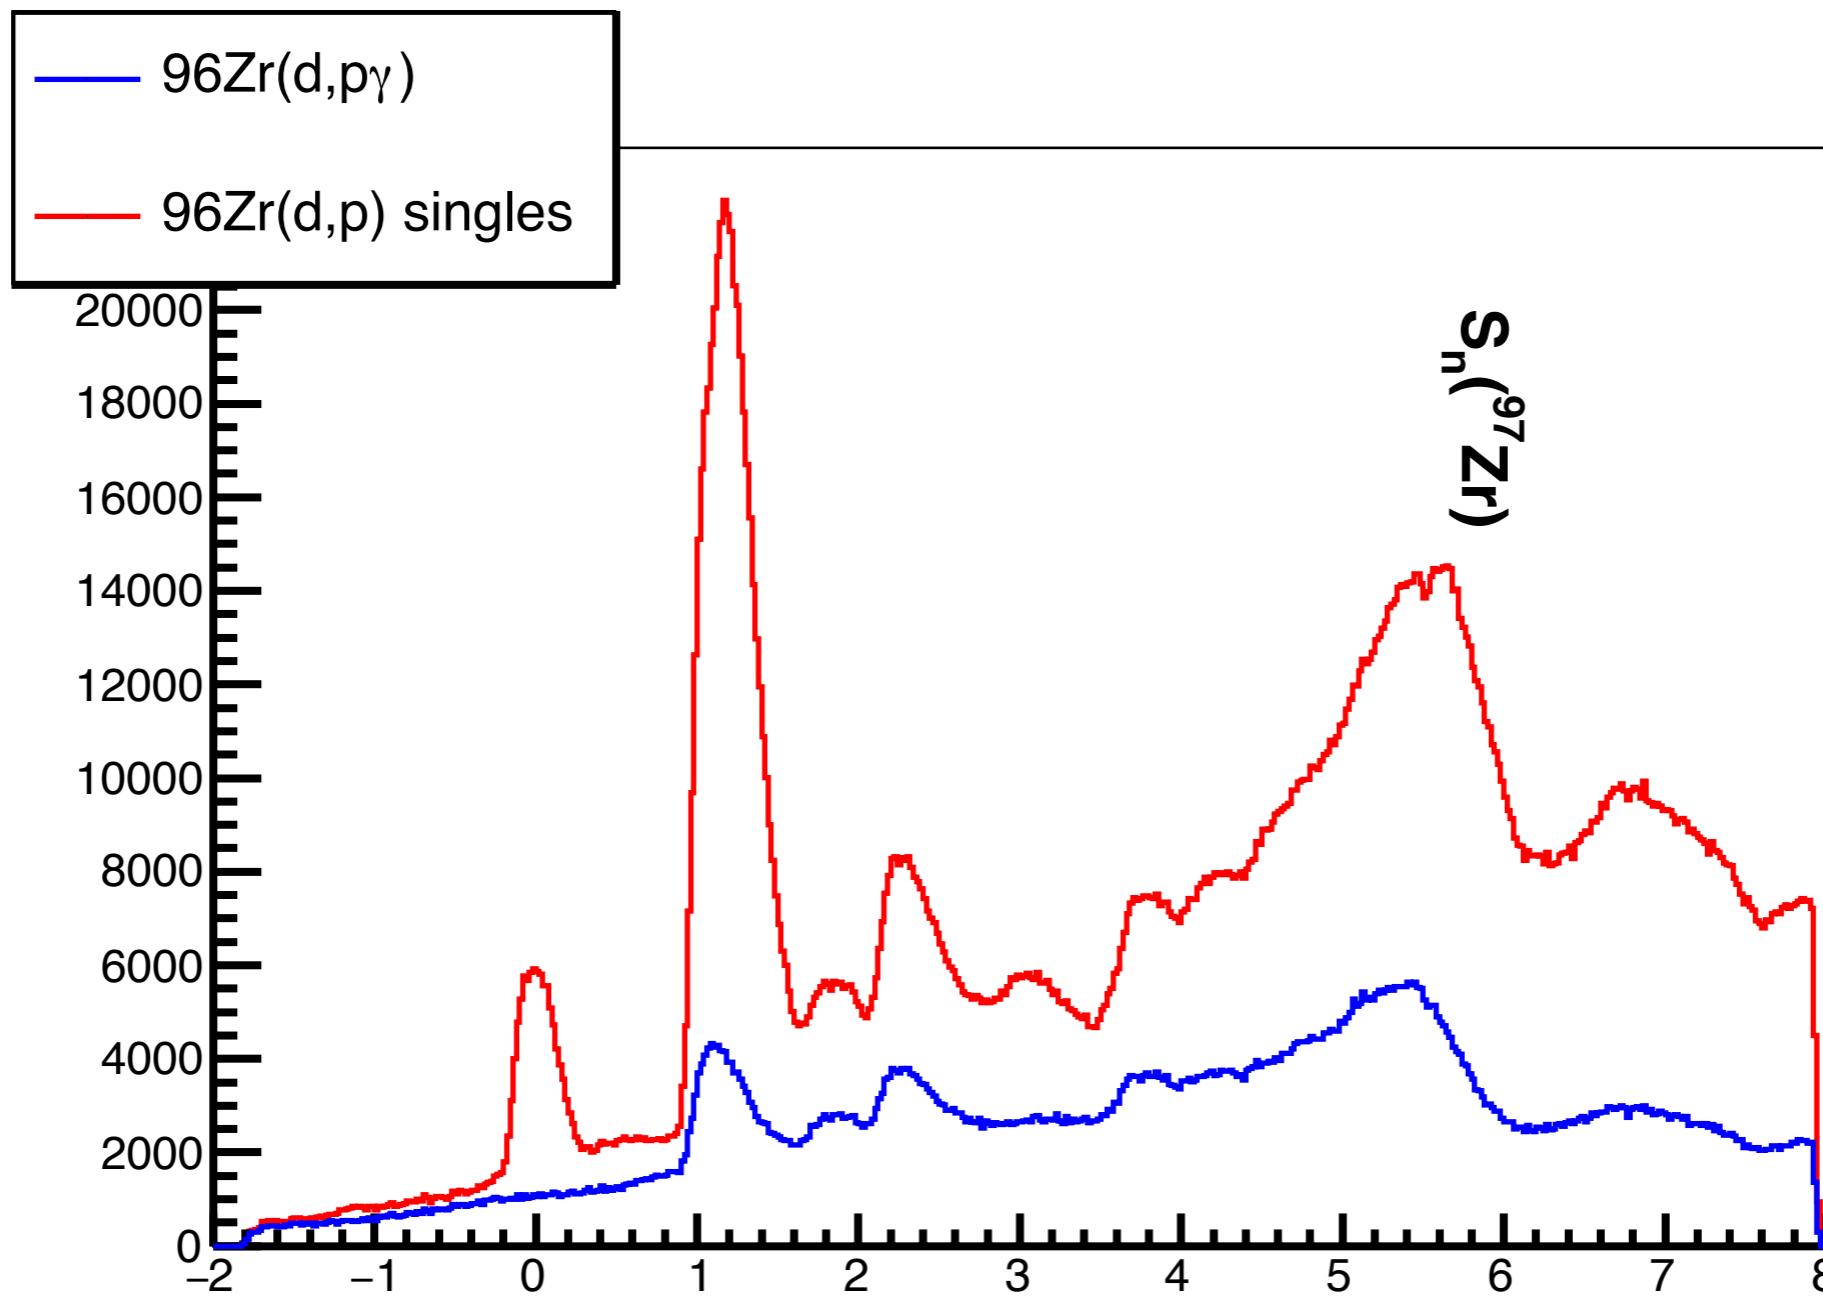

$^{96}\text{Zr}(\text{d},\text{p}\gamma)$

Tue

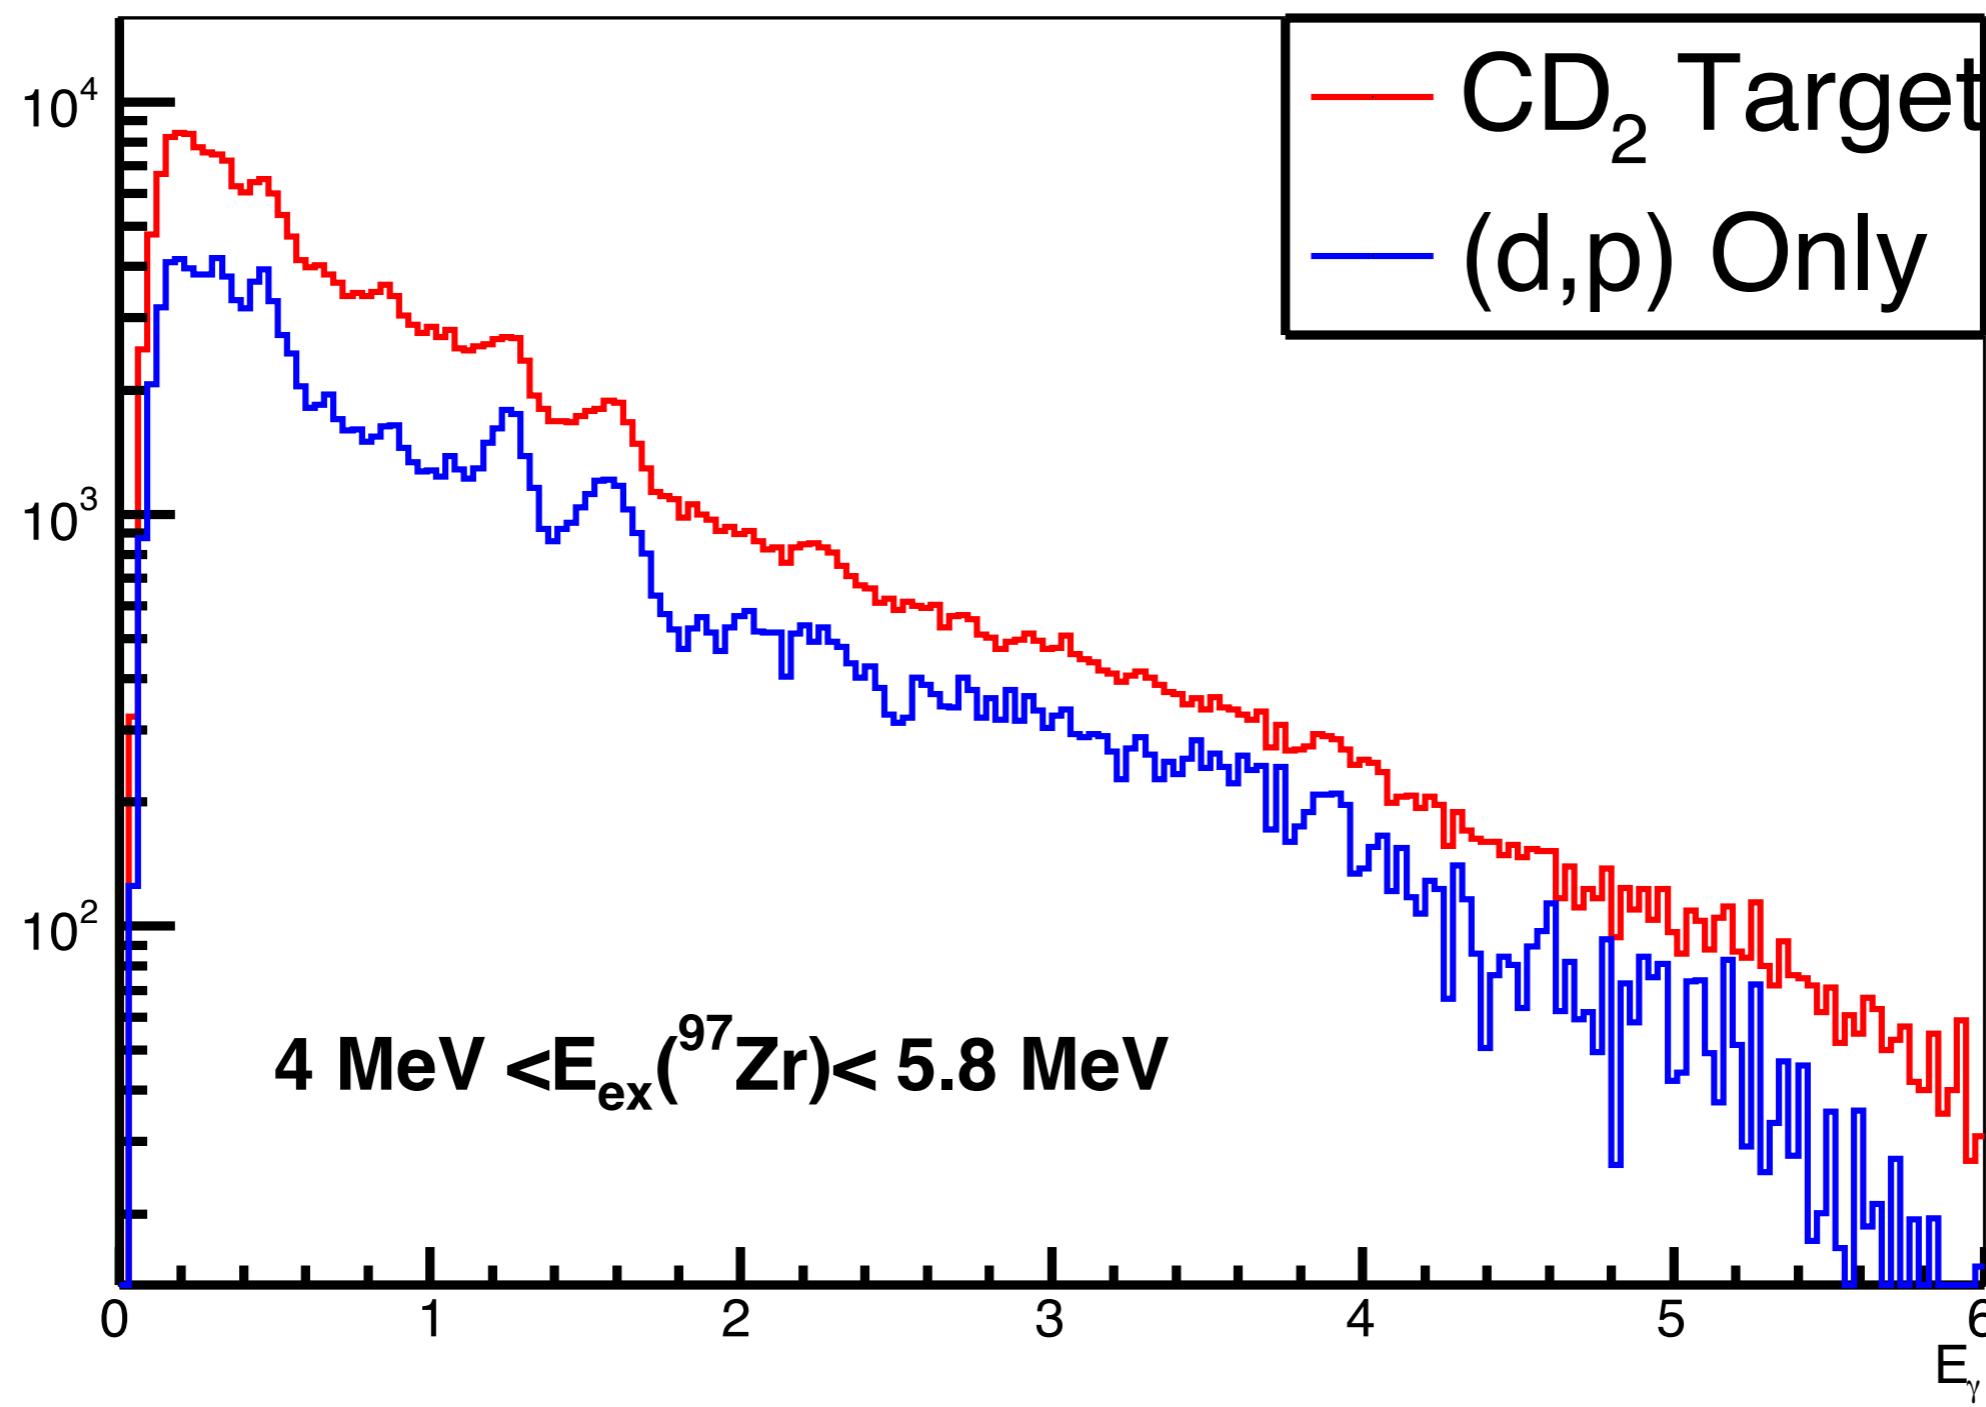

$^{96}\text{Zr}(\text{d},\text{p}\gamma)$

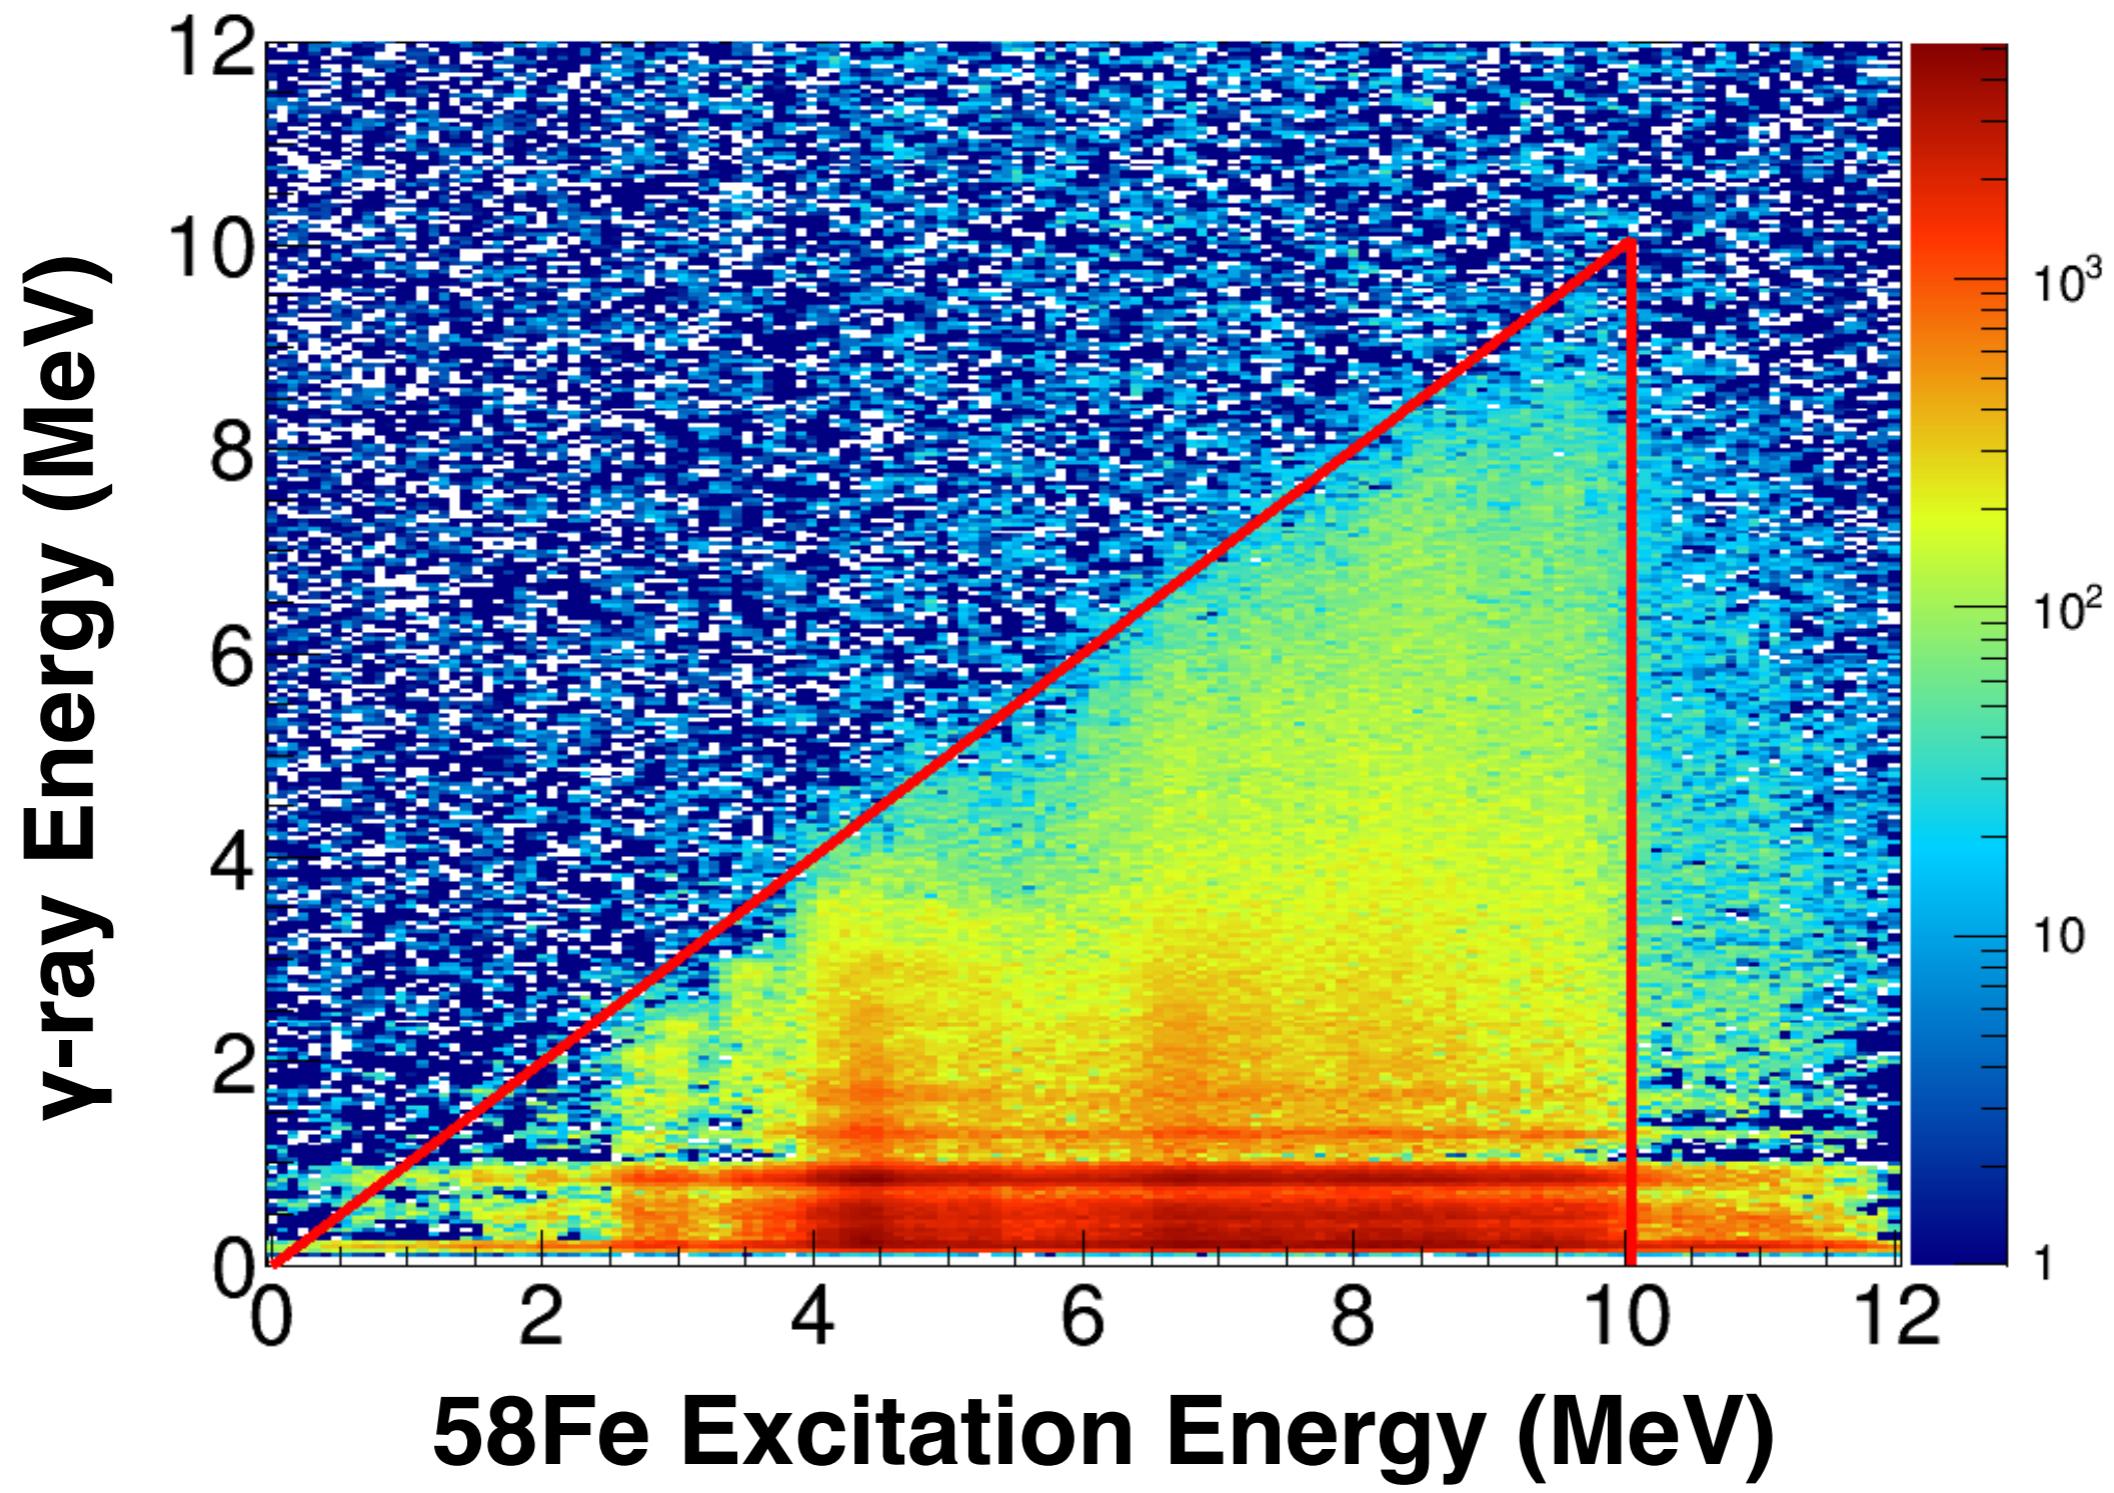

Fri Mar 24 01:07:18 2017

97Zr Excitation Energy (MeV)

γ -ray Spectrum

$^{57}\text{Fe}(\text{d},\text{p}\gamma)$

C. Prokop, LANL Postdoc
